

Java

1. Create a class Employee, inside that create a method Role(). The Role method should take either Salary or Designation as input parameter. Based on the input it should display result.

Eg: emp.Role(10000); should return as "Sales Man"

emp.Role("Sales Man"); should return as 10000

CODE:

```
package operators;
```

```
class Employee {
```

```
    // Role method with salary as parameter
```

```
    void Role(int salary) {
```

```
        if (salary == 10000) {
```

```
            System.out.println("Sales Man");
```

```
        } else {
```

```
            System.out.println("Role not found");
```

```
        }
```

```
    }
```

```
    // Role method with designation as parameter
```

```
    void Role(String designation) {
```

```
        if (designation.equals("Sales Man")) {
```

```
        System.out.println(10000);
    } else {
        System.out.println("Salary not found");
    }
}
}
```

```
public class Employee{
    public static void main(String[] args) {
        Employee emp = new Employee();

        emp.Role(10000);    // Output: Sales Man
        emp.Role("Sales Man"); // Output: 10000
    }
}
```

OUTPUT :

Sales Man

10000
